Life is happening now.  
Unknown?

# Outline

- ▶ Asymptotic notations. Comparing asymptotic quantities.
- ▶ Mathematical notations.

# Asymptotic notations

Asymptotically,

- ▶  $O$ : at most,  $\leq$ .
- ▶  $\Omega$ : at least,  $\geq$ .
- ▶  $\Theta$ : equal,  $=$ .
- ▶  $o$ :  $<$  (will be skipped).
- ▶  $w$ :  $>$  (will be skipped).

## Notation $T(n)$

We often use  $T(n)$  to denote the (maximum) running time of our algorithm for any input of size  $n$ .  $T$  is usually assumed to be a function whose domain is  $\{0, 1, 2, \dots\}$ .

(You can also use  $A, B, C, \dots$  whatever you like..)

Eg. In the sorting problem,  $n$  is the number of 'elements/numbers.'

(The input size can be described by multiple parameters. For example, if the input is a graph, then we often use  $T(m, n)$  where  $m$  and  $n$  refer to the numbers of edges and vertices, respectively.)

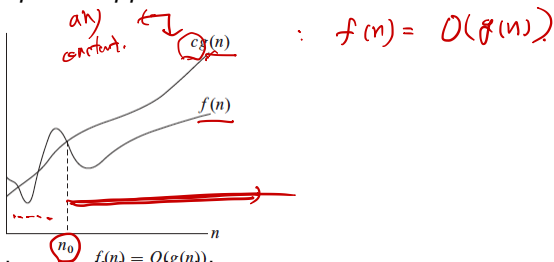

# O-notation

## Definition

$O(g(n)) = \{f(n) : \text{there exist positive constants } c \text{ and } n_0$   
s.t.  $0 \leq \underline{f(n)} \leq \underline{cg(n)}$  for all  $n \geq n_0\}$ .

So, technically,  $f(n) \in O(g(n))$  makes more sense than  $f(n) = O(g(n))$ . But the latter is more popular.

We say that  $g$  is an *asymptotic upper bound* for  $f$ .

Eg.  $\underline{2n^2} = O(n^3)$  since the condition holds

✓ O-notation  $\frac{10n^2}{f} = \frac{O(n^2 + 5n + 12)}{g}$

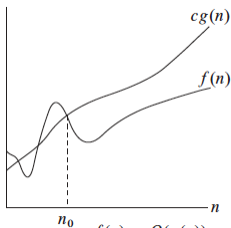

✓  $n^2 + (n+12)$   
 $= \underline{O(n^2)}$

## Definition

$O(g(n)) = \{f(n) : \text{there exist positive constants } c \text{ and } n_0 \text{ s.t. } 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0\}$ .

So, technically,  $f(n) \in O(g(n))$  makes more sense than  $f(n) = O(g(n))$ . But the latter is more popular.

We say that  $g$  is an *asymptotic upper bound* for  $f$ .

$2n^2 \leq \boxed{11} \cdot n^3$   
 for all  $n \geq \boxed{2}$   
 $n_0$

$2n^2 \leq \boxed{10} \cdot n^3$   
 for all  $n \geq \boxed{2}$

Eg.  $2n^2 = O(n^3)$  since the condition  $f(n) = O(g(n))$  holds for  $c = 1$  and  $n_0 = 2$ .

# $O$ -notation

## Informal definition

$O(g(n))$  is the family of functions that are asymptotically smaller than or equal to  $g(n)$ .

So,  $f(n) = O(g(n))$  means  $f(n) \leq g(n)$  'asymptotically'.

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

# O-notation

## Examples

Examples of (functions in)  $O(n^2)$ :

▶  $\underbrace{10000n^2 + 500n} \leq 10000n^2$

# O-notation

## Examples

Examples of (functions in)  $O(n^2)$ :

▶  $10000n^2 + 500n$

▶  $50(\underbrace{n/2})^2 + 2015 \leq 50 \cdot (2n)^2 + 2015 \leq 10000n^2 + 2015$

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶  $100$
- ▶  $n^{1.99}$

# $O$ -notation

## Examples

by  $n \ll n$ .

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100
- ▶  $n^{1.99}$
- ▶  $n \log n$

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100
- ▶  $n^{1.99}$
- ▶  $n \log n$
- ▶  $1000n^2 \log n$

# O-notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100
- ▶  $n^{1.99}$
- ▶  $n \log n$
- ▶  $1000n^2 \log n$  (No!!!!)

$1000n^2 \log n$

$n^2$   $\Rightarrow 1$

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100
- ▶  $n^{1.99}$
- ▶  $n \log n$
- ▶  $1000n^2 \log n$  (No!!!!)
- ▶  $n^2 / \log n$

# $O$ -notation

## Examples

Examples of (functions in)  $O(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100
- ▶  $n^{1.99}$
- ▶  $n \log n$
- ▶  $1000n^2 \log n$  (No!!!!)
- ▶  $n^2 / \log n$

So, you can say  $n^2 / \log n = O(n^2)$ , but not  $n^2 \log n = O(n^2)$ .

Note that  $f = O(g)$  does not imply  $g = O(f)$ .

# O-notation

## Intuitive understanding

1.  $\log n \ll n \ll 2^n$ .

So,  $(\log n)^{100} = O(n)$  and  $n^{10000} = O(2^n)$ .

2. Substitution.

We can derive  $\log n = O(n)$  from  $n = O(2^n)$  by setting  $n = \log_2 k$ .

3. Keep the most significant term and drop its coefficient along with floor/ceiling.

Eg.  $100 + 50n^3 \log n + 50n^5$

But don't mess up with exponents! Eg.  $2^{4n}$  vs  $2^n$ .

# O-notation

## Intuitive understanding

### 4. Sufficient Condition.

If there exists a constant  $c \geq 0$ , such that  $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} \leq c$ ,  
then  $f = O(g)$ .

(Note: not a necessary condition)

L'Hôpital's theorem can be helpful:  $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \lim_{n \rightarrow \infty} \frac{f'(n)}{g'(n)}$  if  
both  $f(n)$  and  $g(n)$  go to infinity as  $n \rightarrow \infty$ .

e.g.  $n = O(e^n)$ .

# $O$ -notation

$O$  is transitive

If  $f = O(g)$  and  $g = O(h)$ , then  $f = O(h)$ . So, if you order functions so that each function is  $O$  of the function right to it, then you asymptotically sorted functions in non-decreasing order.

## Exercise: Asymptotic comparison/sorting

Sort the following functions in asymptotically non-decreasing order:

$n \log n + \log^2 n$ ,  $100\sqrt{n} \log^4 n$ ,  $4^n + 50$ ,  $15n$ ,  $1000^{1000^{1000}}$

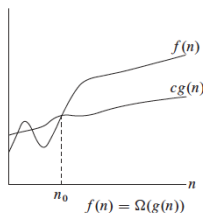

# $\Omega$ -notation

## Definition

$\Omega(g(n)) = \{f(n) : \text{there exist positive constants } c \text{ and } n_0$   
s.t.  $0 \leq cg(n) \leq f(n) \text{ for all } n \geq n_0\}$ .

So, technically,  $f(n) \in \Omega(g(n))$  makes more sense than  
 $f(n) = \Omega(g(n))$ . But the latter is more popular.

We say that  $g$  is an *asymptotic lower bound* for  $f$ .

Eg.  $n^2 - 10n = \Omega(n^2)$  since the condition holds

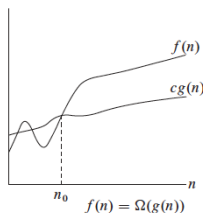

# $\Omega$ -notation

## Definition

$\Omega(g(n)) = \{f(n) : \text{there exist positive constants } c \text{ and } n_0 \text{ s.t. } 0 \leq cg(n) \leq f(n) \text{ for all } n \geq n_0\}$ .

So, technically,  $f(n) \in \Omega(g(n))$  makes more sense than  $f(n) = \Omega(g(n))$ . But the latter is more popular.

We say that  $g$  is an *asymptotic lower bound* for  $f$ .

Eg.  $n^2 - 10n = \Omega(n^2)$  since the condition holds for  $c = 1/2$  and  $n_0 = 100$ .

# $\Omega$ -notation

## Informal definition

$\Omega(g(n))$  is the family of functions that are asymptotically greater than or equal to  $g(n)$ .

So,  $f(n) = \Omega(g(n))$  means  $f(n) \geq g(n)$  'asymptotically'.

# $\Omega$ -notation

## Examples

Examples of (functions in)  $\Omega(n^2)$ :

# $\Omega$ -notation

- ▶ 100 (No!!!!)
- ▶  $n^{1.99}$  (No!!!!)
- ▶  $n \log n$  (No!!!!)
- ▶  $1000n^2 \log n$

# $\Omega$ -notation

## Examples

Examples of (functions in)  $\Omega(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100 (No!!!!)
- ▶  $n^{1.99}$  (No!!!!)
- ▶  $n \log n$  (No!!!!)
- ▶  $1000n^2 \log n$  (Yes)

# $\Omega$ -notation

## Examples

Examples of (functions in)  $\Omega(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100 (No!!!!)
- ▶  $n^{1.99}$  (No!!!!)
- ▶  $n \log n$  (No!!!!)
- ▶  $1000n^2 \log n$  (Yes)
- ▶  $n^2 / \log n$

# $\Omega$ -notation

## Examples

Examples of (functions in)  $\Omega(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶  $100$  (No!!!!)
- ▶  $n^{1.99}$  (No!!!!)
- ▶  $n \log n$  (No!!!!)
- ▶  $1000n^2 \log n$  (Yes)
- ▶  $n^2 / \log n$  (No!!!!)

# $\Omega$ -notation

## Examples

Examples of (functions in)  $\Omega(n^2)$ :

- ▶  $10000n^2 + 500n$
- ▶  $50(\lceil n/2 \rceil)^2 + 2015$
- ▶ 100 (No!!!!)
- ▶  $n^{1.99}$  (No!!!!)
- ▶  $n \log n$  (No!!!!)
- ▶  $1000n^2 \log n$  (Yes)
- ▶  $n^2 / \log n$  (No!!!!)

So, you can say  $n^2 \log n = \Omega(n^2)$ , but not  $n^2 / \log n = \Omega(n^2)$ .

!!Note that  $f = \Omega(g)$  does not imply  $g = \Omega(f)$ .

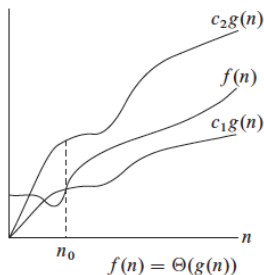

# $\Theta$ -notation

## Definition

$\Theta(g(n)) = \{f(n) : \text{there exist positive constants } c_1, c_2 \text{ and } n_0$   
s.t.  $0 \leq c_1g(n) \leq f(n) \leq c_2g(n) \text{ for all } n \geq n_0\}$ .

As before, people prefer to say  $g(n) = \Theta(f(n))$ .

We say that  $g$  is an *asymptotically tight bound* for  $f$ .

## Theorem

$f = \Theta(g)$  if and only if  $f = O(g)$  and  $f = \Omega(g)$ .

# $\Theta$ -notation

## Informal definition

$\Theta(g(n))$  is the family of functions that are asymptotically equal to  $g(n)$ .

So,  $f(n) = \Theta(g(n))$  means  $f(n) = g(n)$  'asymptotically'.

# $\Theta$ -notation

## Examples

Examples of (functions in)  $\Theta(n^2)$ :

- ▶  $f = O(g)$  if and only if  $g = \Omega(f)$ .

## $O$ and $\Theta$ in equations and inequalities

In equation, we may use  $O()$  or  $\Theta()$  to refer to a function that we do not care to name. For example, say we want to hide messy details of  $2n^3 + n^2 + 10n + 5$ . Then, we can simply say

$$\begin{aligned} 2n^3 + n^2 + 10n + 5 &= 2n^3 + O(n^2) \text{ or} \\ 2n^3 + n^2 + 10n + 5 &= 2n^3 + \Theta(n^2) \end{aligned}$$

## $O$ and $\Theta$ in equations and inequalities

In equation, we may use  $O()$  or  $\Theta()$  to refer to a function that we do not care to name. For example, say we want to hide messy

details of  $2n^3 + n^2 + 10n + 5$ . Then, we can simply say

$$2n^3 + n^2 + 10n + 5 = 2n^3 + O(n^2) \text{ or}$$

$$2n^3 + n^2 + 10n + 5 = 2n^3 + \Theta(n^2).$$

If we want to simplify it further, we can say  $2n^3 + \Theta(n^2) = \Theta(n^3)$ , meaning that for any function in  $\Theta(n^2)$ , the LHS is in  $\Theta(n^3)$ .

# Asymptotic notation in summation or recursion

Examples:

# Asymptotic notation in summation or recursion

Examples:

►  $T(n) = 2T(n/2) + O(n)$

# Asymptotic notation in summation or recursion

Examples:

- ▶  $T(n) = 2T(n/2) + O(n)$
- ▶  $\sum_{i=1}^n O(i)$ .

# Mathematical notation

- ▶  $f$  is monotonically increasing (or equivalently non-decreasing) if  $m \leq n$  implies  $f(m) \leq f(n)$ .
- ▶  $f$  is monotonically decreasing (or equivalently non-increasing) if  $m \leq n$  implies  $f(m) \geq f(n)$ .
- ▶  $f$  is strictly increasing if  $m < n$  implies  $f(m) < f(n)$ .
- ▶  $f$  is strictly decreasing if  $m < n$  implies  $f(m) > f(n)$ .

# Mathematical notation in this book

- ▶  $\lg n = \log_2 n$  (binary log).
- ▶  $\ln n = \log_e n$  (natural log).
- ▶  $\lg^k n = (\lg n)^k$ .
- ▶  $\lg \lg n = \lg(\lg n)$ .
